

**CELLULAR FOAM**

# Everad® TAC 4891.0

## For increased productivity

### Productivity improvements

The application of adhesive using rollers enables high productivity while flat gluing foam. When combined with TAC 4891.0, the method will lead to productivity improvements, better process control and lower costs.

### Everad® TAC 4891.0

TAC 4891.0 adhesive has been developed specifically for application using rollers. It has been formulated for high stability, high initial tack and great ease of cleaning, both at the end of a production run and after a night's drying.

As it can also be applied by spraying, it allows gluing of formed parts subject to constraints. That versatility leads to a reduction in immobilised stock and better rotation of your supplies.

Its high initial tack and shear resistance mean that this adhesive can be spread finely and allow strong bonding at the same time.

### The roller application process will also offer the following benefits:

- Perfectly suitable for gluing surfaces with a variety of shapes and sizes
- Versatile, application using machines and spraying
- Single application
- Close control over the quantities applied
- Increased productivity thanks to more reliable production processes
- Speedy application
- Easy cleaning at the end of the process
- Low and easy maintenance

### Everad® TAC 4891.0 will offer the following additional benefits:

- 100% solvent-free
- Single-component
- Fine spread, weight per unit area halved.
- Adhesive for foam on foam, foam on wood, fabric on foam or other materials
- Fast setting and drying
- High final bond
- High efficiency
- High-speed process with single application
- Repositioning possible
- Soft joint
- Easy cleaning

High performance when finely spread

Quick setting on a variety of materials

Easy dry cleaning
